E. Paso, Tex.—Sixty rebels killed when 500 federals sent from Ojinaga encountered 400 of Orozco's rebel army five miles from Coyame.

WHY YOU SNORE

Snoring is often an indication of the presence of a foreign substance in the nasal cavities. Its immediate cause is using the nose and mouth to breathe with.

A person who is snoring is usually lying with the mouth wide open, and often on the back. The soft palate caught between the two currents in nose and throat flutters back and forth. Many cures have been offered at different times.

Frequently sleeping on the side helps. It is not a bad plan to wake persons who are snoring loudly and get them to change their position from back to side, or from side to side.

Sometimes it is necessary to remove spurs or polyps from the nose. Some people resort to nose closing devices, but the objection to these is that the mouth would get dry.
